3.1.1. Numpy Array Operations

05:16

Write a Python program to create a NumPy array based on user input and display the following:

- The created NumPy array.
- The number of dimensions of the array using `ndim`
- The shape of the array using `shape`
- The total number of elements in the array using `size`

Assume all input elements are valid integers.

Input Format:

- The first line contains two space-separated integers, `rows` and `columns`, representing the number of rows and the number of columns.
- The next `rows` lines contain space-separated integers representing the elements of the array, entered row by row.

Output Format:

- The created NumPy array (printed as a 2D array).
- An integer representing the number of dimensions of the array.
- A tuple representing the shape of the array.
- An integer representing the total number of elements in the array.

Note: Use `reshape()` function to reshape the input array with the specified number of rows and columns.

```
import numpy as np
```

```
# Read rows and columns
```

```
r, c = map(int, input().split())
```

```
elements = []
```

```
# Read elements row by row
```

```
for _ in range(r):
```

```
    elements.extend(list(map(int, input().split())))
```

```
# Create NumPy array and reshape
```

```
arr = np.array(elements).reshape(r, c)
```

```
# Output
```

```
print(arr)
```

```
print(arr.ndim)
```

```
print(arr.shape)
```

```
print(arr.size)
```
