#### 4.1.3. Student Information

01:49

Write a program to read a text file containing student information (name, age, and grade) using Pandas. Perform the following tasks:

- Display the first five rows of the data frame.
- Calculate the average age of the students (limit the average age up to 2 decimal places).
- Filter out the students who have a grade above a certain threshold (consider the threshold grade is '**B**').

**Note:**

Refer to the displayed test cases for better understanding.

```
import pandas as pd
```

```

# Prompt the user for the file name
file_name = input()

# Load the data
df = pd.read_csv(file_name)

# Prepare data for calculation
df['Date'] = pd.to_datetime(df['Date'])
df['Month'] = df['Date'].dt.to_period('M')
df['Sales'] = df['Quantity'] * df['Price']

# Find the month with the highest total sales
best_month = df.groupby('Month')['Sales'].sum().idxmax()
highest_sales = df.groupby('Month')['Sales'].sum().max()

print(f"Best month: {best_month}")
print(f"Total sales: ${highest_sales:.2f}")

```

The screenshot displays a code execution interface with the following components:

- Performance Metrics:**
  - Average time: 0.035 s (34.67 ms)
  - Maximum time: 0.063 s (63.00 ms)
- Test Results:**
  - 1 out of 1 shown test case(s) passed
  - 2 out of 2 hidden test case(s) passed
- Test Case Details:**
  - Test case 1:** 63 ms, Debug mode.
  - Expected output:**
    - sales\_data.csv
    - Best month: 2025-01
    - Total sales: \$1210.00
  - Actual output:**
    - sales\_data.csv
    - Best month: 2025-01
    - Total sales: \$1210.00
- Navigation:**
  - Terminal
